

next observation o_{t+1} . Dense inference makes one call per m executed actions

icons: light fill = token reused from $t-1$ or protected layer, dark = flagged patch, ring = protected neighbours, dashed struck = removed layer, grey = blurred

Protocol

Reference

the released policy, weights frozen, dense inference under fused attention

Matched episodes

same seeds for every condition, paired comparison on each backbone

Grid

every backbone on each environment with a released checkpoint at the evaluated size

Positive gate

latency down, own signal cost included, or success up, the other within a margin
