

Guarded reuse

When the image and action gates pass, the call is skipped and the previous action repeated, consecutive skips capped.

Temporal fusion

Between keyframes, a capped number of unprotected patches keep the token the decoder saw at the previous call.

Depth pruning

With the first layers and the last kept, the layers lowest in Block Influence are removed, no two adjacent.

Foveation

The image is increasingly blurred outside a central disc and keeps its token count.

Action repeat

Each action is held for k steps, with a call only on the first.

Dots and the diamond mark where each intervention takes effect, and the dashed path marks the skipped call.
