

Temporal fusion

candidate

motion, entropy, attention mask
stable patches keep the $t-1$ token
capped, keyframes bound drift

Depth pruning

candidate

Block Influence ranking
ends protected, none adjacent
layers removed, not bypassed

Guarded reuse

candidate

all pass: reuse a_{t-1}

any fails: dense call

image and action gates before the call
pass: skip the call, reuse a_{t-1}

Observation o_t
image, instruction

Visual encoder
patch tokens

Decoder layers

Output stage
tokens or head

Action a_t
 m per call

Environment
one step

next observation o_{t+1}

Foveation

control

sharp disc, blurred
periphery, same tokens

Protocol

dense reference under fused attention, weights frozen
matched episodes, paired by seed, on every backbone and environment with a checkpoint
positive only if latency falls, own signal cost included, or success rises, other within a margin

Action repeat

control

k steps

hold each action k steps, no gate
