

## Guarded reuse

When the image and action gates pass, the call is skipped and the previous action repeated, and consecutive skips are capped.

## Temporal fusion

Between keyframes, a capped number of unprotected patches keep the token the decoder saw at the previous call.

## Depth pruning

With the first layers and the last kept, the layers lowest in Block Influence are removed, and no two are adjacent.

## Foveation

The image is increasingly blurred outside a central disc and keeps its token count.

## Action repeat

Each action is held for  $k$  steps, with a call only on the first.

Dots and the diamond mark where each intervention takes effect, and the dashed path marks the skipped call.
